production of contraceptives. They can also be used to identify chemicals or biological compounds able to trigger the (premature) activation or inhibition of the Responder/Discorter signalling cascade, or to identify and isolate receptors and other members of the cascade that bind the expression products. The methods for detecting the sperm of the cansopenic animal, and selecting against (I) also provide a means for distorting the transmission ratio of genetic traits by altering genes of the Responder/Distorter signal cascade other than the t-Responder. They also allow distortion, to a non-Mendelian ratio, of the transmission of a genetic trait, i.e. determination of sex, from male mammals to their cantoved in sperm motility and/or fertilisation. The genes and proteins involved in the responder phenotype and Responder/Distorter signalling cascade, as well as the inventive methods are advantageous in breeding strategies by allowing for specific selection of genetic traits and in particular, of sex
                                                                                                                                                                                                                                                                                                                                 ö

                                                                The present invention describes compounds of 8-30 nucleobases antisense to a nucleic acid encoding human or mouse tumour necrosis factor receptor 2 (TNRR2). Also described is a method for inhibiting expression of human or mouse TNRR2 comprising contacting cells or tissues in vitro with one of the claimed compounds. The antisense compounds are used to treat a disease or condition associated with expression of TNRR2. The present sequence represents a human TNRR2 antisense chimeric phosphorothioate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pharmaceutical composition for treating allments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or masal alraway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive,

                                                                      antinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstruction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; antisense; bronchoconstriction, allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic, antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cycostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory districtions and respiratory districtive beta-adrenergic obstructive pulmonary disease; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                comprising oligonuclectides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonuclectides are derived from a gene encoding or regulating
immunosuppressive, and cytostatic activity. The composition may have a mee in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel composition (a) a first active agent

expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.

The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligomoclectides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or vailability, or to increase the degradation of the target mRNA or to composition comprises oligo and is administered to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lungs or inflammation, allergies and/or bronchoconstriction and/or lung inflammation, allergies asthma, impeded respiratory disease, pulmonary contains asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system center any unwanted effects due to it Sequence 20 BP; 4 A; 2 C; 7 G; 7 T; 0 U; 0 Other; 8599999999999999999999999

New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.

nucleic acid molecule encoding Nav1.3, where the antisense compound specifically hybridizes with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition associated with Nav1.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present

The present invention relates to an antisense compound targeted to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navl.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, lower back pain, pain from burns, migrainne headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate oligomicleotide with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense compound targeted to a nucleic acid molecule encoding abav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.
                                                                                                                                                                                                                                             Gaps
sequence represents a chimeric phosphorothioate oligonucleotide with 2'MOS wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target different regions of the human Navl.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Nav1.3 expression, the oligonucleotides are designed to target different regions of the human Nav1.3 RNA.

The invention relates to a method of treating a neurodegenerative disorder comprises administering to an individual calls capable of exogenously regulatable neurotransmitter synthesis. Treating a neurodegenerative disorder comprises administering to an individual cells capable of exogenously regulatable neurotransmitter synthesis and periodically exposing the individual to an agent or condition capable of regulating the synthesis of the neurotransmitter in the cells. The method and cells are useful in treating a neurodegenerative disorder e.g. multiple sclerosis, amyotrophic lateral sclerosis, autoimmune encephalomylitis, Alzheimer's disease, or Huntington's disease, preferably Parkinson's disease. The present sequence represents a human CD90 reverse transcription (RT)-PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The invention comprises the amino acid and coding sequences of novel human proteins - designated NoVX proteins (e.g. NoV1). The NoVX DNA and protein sequences are useful for treating or preventing NOVX-associated disorders, such as: diabetes; obesity; infectious disease; anorexia; neurodegenerative disorders; Alzelmer's disease; Parkinson's disease; immune disorders; haematopoietic disorders; dyslipidaemias; metabolic syndrome X; wasting disorders; cancer; Chron's disease; cirrhosis; liver failure; infertility; cardiomyopathy; atherosclerosis; hypertension; scleroderma; haemophilia; pancreatitis; asthma; pain; psoriasis; and epilepsy. The NoVX DNA sequences of the invention are useful in screening assays and detection assays (e.g. chromosomal mapping, tissue typing and forensic biology). The NoVX DNA sequences can also be used to create a transpent of animal. The present DNA sequence represents a NoVX gene PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated human polypeptide, designated NOVX, useful for treating or preventing cancer, diabetes, obesity, dyslipidemia, anorexia, and metabolic, neurodegenerative, immune and hematopoietic disorders.
                            diabetes; obesity; infectious disease; neurodegenerative disorder; ss; anorexia; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; dyslipidaemias; metabolic syndrome X; cancer; wasting disorder; Chron's disease; cirrhosis; liver failure; infertility; cardiomyopathy; atherosclerosis; hypertension; scleroderma; haemophilia; pancreatitis; asthma; pain; psoriasis; epilepsy; chromosomal mapping; tissue typing; forensic biology; transgenic animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Furtak K, Perna A, Patturajan M, Shimkets RA, Guo X;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA sequences AAH62100 - AAH62688 represent segments of human genes which contain single nuclectide polymorphisms (SNPs). A method is included in the invention for analysing a nucleic acid sample, which consists of determining the base occupying any one of the polymorphic sites of its agnosis or monitoring of diseases, such as cancer, inflammation, heart diseases, diseases of the cardiovascular system, and infection by microorganisms. The oligonucleotides are also useful in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as a pharmaceutical. SNP containing oligonucleotides are useful in applications such as pharmaceutical in the manufacture of a medicament for the creating oligonucleotides are useful in applications such as pharmaceutical.
                                                                                                               Proteasome 26S subunit ATPase polymorphism containing DNA fragment #341.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid segments of the human genome, particularly from genes including polymorphic sites, for phenotype correlation, forensics, paternity testing, medicine and genetic analysis.

cardiant, hypotensive, antiarteriosclerotic, anorectic, virucide, cardiant, hypotensive, antiarteriosclerotic, anorectic, virucide, cardiant, hypotensive, antiarteriosclerotic, ancuroprotective, antibacterial, fungicide, profecoacide, noctropic, neuroprotective, antiarthritic, antiarthritic, antiarthritic, antiarthritic, antiarthritic, antiarthritic, antiarthritic, antinflammatory, dermatological, antiarchment antilipaemic cartivities. The polypeptides, nucleic acid molecules and antilipaemic cartivities. The polypeptides, nucleic acid molecules and antilipaemic characters, diabetes, obseity, infectious diseases (viral, bacterial, tungal, helmithic, and protezeal), anorexia, cancer, cardiovascular diseases including hypertension and atherosclerosis, neurodegenerative ciscorders, Alzheimer's disease, Parkinson's disease, epilepsy, immune ciscorders, asthma and various types of dyslipidaemia. The nucleic cacids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit neurogenesis, cell differentiation, cell proliferation, haemopoiesis, wound healing and anglogenesis, in gene therapy and the in generation of antibodies that child immunospecifically to NOVX substances for use in therapeutic or diagnostic methods. The nucleic acids may be further used as
                                                                                                                                                                                                                                                                                                                                                                                                                                          hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The current sequence is that of the human NOVX-related PCR primer which was used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Compsn. of monoclonal antibodies against interferon receptor - useful as immuno:modulator, eg. for treating AIDS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel method for identifying an inhibitor of potentially useful for treatment of cancer, where the inhibitor is active potentially useful for treatment of cancer, where the inhibitor is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele present in cells of the precancerous condition, where the normal somatic present in cells of the precancerous condition, where the normal somatic colls of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic form present in the cused in the diagnosis, prevention and treatment of LOH disorders, e.g. used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benigh tumours, endometriods, polycystic kindrey disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z26825 represent human polymorphic sites described in the method of the invention
                                                                                                                                                ö
in the sera of HIV-infected individuals. IFN-alpha-5 was the dominant IFN species present. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polymorphism; human; inhibitor; cancer; treatment; cell growth; LOH; cell viability; loss of heterozygosity; precancerous condition; ASI; allele specific inhibitor; somatic cell; diagnosis; prevention; atherosclerotic plaque; premalignant metaplaetic lesion; endometriosis; dysplastic lesion; behign tumour; polycystic kidney disease; transplant; graft versus host disease; malignant cell removal; bone marrow; ss.

The antagonist is selected from a mutein of natural CTACK or Vic. an antibody which neutrallses CTACK or Vic or an antibody which block GPR2 ligand binding. The CTACK or Vic agonists or antagonists are useful for treating medical conditions or diseases associated with immunological conditions of the skin. Two primers (AAA47554, AAA47555) were used to amplify a human CTACK fragment for use in competitive RT-PCR

This sequence represents a primer which was used in quantitative analysis of protein expression in pro-B cells cell man origin that are deficient in functional Pax5 expression. The autologous human Pax5-deficient pro-B cells or pax5-deficient pro-B cells derived from a HiA-matched donor are useful in treating disorders associated with a depletion of the lymphoid system, including immunodeficiencies or AIDS. Pax5-deficient pro-B cells derived from an HiA-matched donor are also useful in treating tumours. Alternatively, the pro-B cells derived from an HiA-matched donor are also useful in the pro-B cells derived from an HiA-matched donor are inseful in non-myeloablative tumour therapy. The expression of the Pax5 gene is inactivated by means of antisense RNA, small interfering RNA or riboxyme. In inactivated by means of antisense RNA, small interfering RNA or siboxyme. In inactivating the expression of the Pax5 gene is inserted into lentiviting the expression of the Pax5 gene is inserted into lentivital vector. The lentivital vector is transfected in the proper particulated packaging cells to generate pseudoxypped lentivity and provided the properties of the pax5 into appendix the properties of the pax5 into appendix the pax5 into a provider molecules and provider molecules and provider particulated packaging cells to generate pseudoxypped lentivity and provided particulated packaging cells to generate pseudoxypped lentivity and particulated packaging cells to generate pseudoxypped lentivity and particulated pack particulated packaging cells to generate pseudoxypped lentivity and packaging cells to generate pseudoxypped lentivity and packaging cells to generate packaging cells to packaging cells to packaging cells to packaging cells to packaging ce

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      a mammal that is modulated by administering to a mammal an antagonist of CTACK, an agonist of CTACK, an antagonist of vic, or an agonist of Vic. The methods are useful for modulating movement of a cell within or to the skin of a mammal, purifying a populating of cells, producing a ligand: receptor complex, modulating physiology or development of a GPR2 receptor complex, modulating physiology or development of a GPR2 receptor-ligand interaction, and for treating a patient suffering from a skin disorder such as psoriasis, skin cancer, carcinoma, inflammation, allergies, contact dermatitis, allergic dermatitis, wound healing and infections (including microbial, viral and parasitic) comprising administering an antagonist against GPR2, vic or CTACK. The invention regulates the development or physiology of relevant cells. The present sequence represents the human cutaneous-T-cell-attracting chemokine CTACK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Modulating movement of cell within or to the skin of mammal useful for treating a skin disorder comprises administering an antagonist/agonist of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to novel compositions that comprise short conterfering RNA (siRNA) molecules, which can be used to inhibit and cause and ordered aggradation of mRNA from human vascular target and cause continuous degradation of mRNA from human vascular endothelial growth cactor (VEGF), the VEGF receptor (FIL-1) and the FIk-1/KDR (kinase domain cactor (VEGF), the VEGF receptor (FIL-1) and the FIk-1/KDR (kinase domain cactor) genes, as well as mutants derived that form an RNA duplex and describes sense and antisense RNA strands that form an RNA duplex and control to the target mRNA, such that expression is inhibited and the target bind to the target mRNA, such that expression is inhibited and the target of agent is useful for treating disease associated with anglogenesis and the overexpression of VEGF, which include diabetic retinopathy, agented macular degeneration, inflammatory disease, psoriasis and related macular degeneration, inflammatory disease, psoriasis and cancers including breast, retinoblastoma, Wilm's tumour and lymphoma. Concers including breast, retinoblastoma, Milm's tumour and lymphoma. Concers including breast, retinoblastoma, wilm's tumour and lymphoma. Computhalmological, antiinflammatory, antipsoriatic, antitihemmatic and antiarthritic activities. This oligomucleotide is a human Flt-1 DNA coligo, a target for sirNA inhibition of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

This invention relates to novel compositions that comprise short control interfering RNA (siRNA) molecules, which can be used to inhibit considered and cause anglogenesis. Specifically, it refers to siRNAs that tearget and cause RNA-induced degradation of mRNA from human vascular endothelial growth factor (VEGF), the VEGF receptor (Flt-1) and the Flk-1/KDR (kinase domain region) genes, as well as mutants derived thereof. The present invention conscribes sense and antisense RNA strands that form an RNA duplex and antisense RNA strands that form an RNA duplex and confidence of the to the trarget mRNA, such that expression is inhibited and the target confidence as such, siRNA administered in combination with a therapeutic degraded. As such, siRNA administered in combination with a therapeutic conscribed actual for treating diseases associated with anglogenesis and related macular degeneration, inflammatory disease, psoriasis and related macular degeneration, inflammatory disease, psoriasis and concern including breast, retinoblascoms, Wilm's tumour and lymphoma. Concerningly, these compositions exhibit cytostatic, antidiabetic, ophthalmological, antiinflammatory, antipsoriatic, antitheumatic and antiarthritic activities. This oligomuclectide is a human Flt-1 DNA coligo, a target for sirNA inhibition of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; ss; antisense therapy; cytostatic; antiinflammatory; haemostatic; cerebroprotective; nootropic; neuroprotective; antiparkinsonian; muscular; CD20; neurite growth inhibitor gene; NGG0; hammerhead ribozyme; DNAzyme; inozyme; G-claaver; amberzyme; zinzyme; lymphoma; leukaemia; B-cell lymphoma; non-Hodgkin's lymphoma; MHL; lymphocytic leukaemia; human immunodeficiency virus; HIV associated NHL; mantle-cell lymphoma; MCL; immunocytoma; IMC; immune thrombocytopaenia; stroke; dementia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel short interfering RNA (siRNA) comprises sense and antisense RNA strands, useful for inhibiting expression of human vascular endothelial growth factor mRNA, for treating angiogenic disease, e.g. diabetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cregulates expression of a neurite growth inhibitor gene (NGOD). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule or possessing an NCH motif), a G-leaver (cleaving RNA with a NKH with a NYN motif) proceed of CD20 in the presence of a divalent cation that is preferably Mg^2+.

C for CD20 in the presence of a divalent cation that is preferably Mg^2+.

C Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more contacted in particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-call lymphoma, low-grade or follicular non-Hodgkin's lymphoma (MLL), bulky low-grade or follicular NHL, lymphocytic lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, created may be contacted with a cell to reduce NGGO activity of the presence of a divalent daving a condition associated with he level of cell and treat a patient having a condition associated with he level of NGO. The treatment may further comprise the use of one or more cell and treat a patient having a condition associated with he level of therapies. In particular, the NOGO-tragetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CNA, stroke), Alzheimer's disease, demential, multiple sclerosis (MLS), chemotherspy-induced neuropathy, anyworrophic lateral sclerosis (MLS), chemotherspy-induced neuropathy, anyworrophic lateral sclerosis (MLS), chemotherspy-induced neu
inflammatory arthropathy; central nervous system injury; cerebrovascular accident; CVA; Alzheimer's disease; multiple sclerosis; chemotherapy-induced neuropathy; amyotrophic lateral sclerosis; ALS; Parkinson's disease; ataxia; Huntington's disease; Creutzfeldt-Jakob disease; muscular dystrophy; neurodegenerative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NOGO expression. The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 08% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the concleotides the nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversibion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transpenic animals, as experimental models. The nucleotides (also vectors containing them and calls containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or viral infections or diseases characterized by development of tumours or viral infections or diseases characterized by development of tumours or viral infections or diseases or schraderized by development of tumours or viral infections or diseases or schraderized by development of tumours or viral infections or diseases or schraderized by development of tumours or viral infections or diseases or schraderized by development of tumours or viral infections or diseases or schraderized by development of tumours or viral infections or diseases or schraderized by development or tumours or viral infections or diseases or schraderized by development or tumours or viral infections or diseases or schraderized by development or tumours or viral infections or diseases or schraderized by development or viral v

AAV37774:

```
The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a grequence having at least 80% identity, after optimal alignment, with the complement complement, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides. Or the complement, or corresponding RNA, of the the nucleotides. The nucleotides are used as probes or primers for detecting, contribying and/or amplifying nucleic acids, as in vitro identifying, quantifying and/or amplifying nucleic acids, as in vitro suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as recombinant polypeptides, and to prepare transgenic animals, as recombinant polypeptides, and to prepare transgenic animals, as recombining the vectors), the encoded polypeptides and antibodies calls containing the vectors), the encoded polypeptides and antibodies of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides and polypeptides can and or and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                        cytostatic; antiviral; neuroprotective; nootropic; neuroleptic; ss; primer; probe; tumour suppression; tumour reversion; apoptosis; virus resistance; transgenic animals; Alzheimer's disease; schizophrenia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

```
Analytical solid phase for detecting nucleic acids - contains a base sequence which hybridises with polynucleotide sequence of the target, and a set of probes immobilised on the solid phase via a linker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a probe used in an example from the present invention. The present invention describes an analytical solid phase method for detecting nucleic acids. The method comprises obtaining a base sequence which hybridises with the polynucleotide sequence of the target, and a set of probes immobilised on the solid phase via a linker which is enzymatically ligated during hybridisation. The product is used for the detection of specific nucleic acids. Possible fields of sepplication include diagnosis of disease, detection of drug sensitivity, screening for appropriate transplantation organs, testing in the food industry to prevent food poisoning. A simple, quick method for selectively detecting target in a mixed sample is obtained
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             5'-phosphorylated and 3'-biotinylated probe (Seq ID No: 5 of WO9935287).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Two-probe system; nucleic acid detection; hybridisation; immobilisation; phosphorylation; diagnosis; infectious disease; drug receptor; toxin;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            target polynucleotide sequence. The system consists of two probes are which hybridise to adjacent sections of the target polynucleotide. These are immobilised by their 5' and 3' ends respectively to a solid phase and the free end of one is phosphorylated. One probe is labeled and is connected to the solid phase via a breakable section. The test sample is introduced and after hybridisation to the target polynucleotide sequence (if present) a ligase is added to join the non-immobilised ends of the probes. The target polynucleotide chain is removed, and the breakable section split. If the target sequence was present, the labeled probe remains immobilised to the solid phase because of ligation to the other probe, but if the target sequence was not present it is released. Detection of the label on the solid phase shows that the target sequence was present in the test sample. The method is used for the datection of specific nucleotide sequences in applications such as the diagnosis of infectious and other diseases, the detection of drug receptors, and is able to discriminate the target sequence from sequences containing a single base mismatch is sequence and sequences containing a single base mismatch is sequence and sequences containing a single base mismatch is represent probes and

The present invention relates to a method and apparatus for transgenic and targeted mutagenesis screening of genomic DNA. The method comprises depositing genomic DNA on a substrate, adding at least one labelled probe specific for a portion of the genomic DNA, and detecting the signal from the probe. The invention also provides a system for screening DNA for a designated genetic sequence, the system includes a computer having a processor, memory, web browser and an automatic screening device that analyses samples of genomic DNA for the designated sequence. The method is useful for detecting a designated genetic sequence. The method is useful for detecting a designated genetic sequence in a sample of genomic DNA. The method is useful for tapid identification of an organism, whose genome possesses specific genetic sequences that exist endogenously or has been modified, mutated or genetically engineered. The method is more accurate, faster and is a high volume transgenic and targeted mutagenesis screening method. The screening results are provided to a researcher more quickly than by the prior art methods. The present sequence for Streptomyces hygroscopicus hygromycin probe is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô
                                                                                                                                                                                                                                                                                                                                         Detecting designated genetic sequence in genomic DNA sample, comprises depositing genomic DNA on substrate, adding labeled probe specific for portion of DNA and detecting signal from labeled probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PLA2G1B; fat deposition; leanness; single nucleotide polymorphism; non-insulin dependent diabetes mellitus; NIDDM; hypertinsulinemia; hypertension; glucose intolerance; dyslipidemia; hypercoagulability; microalbuminuria; human; PCR; primer; ss; SNP.

The invention relates to diagnosing a predisposition to fat deposition or leanness in a subject comprising detecting the presence or absence of a polymorphic variation associated with fat deposition at a polymorphic site in a PLA2GIB nucleotide sequence in a nucleic acid sample from a subject, where the presence of the polymorphic variation is a guanne at position 7138 or thymine at position 9182 of the present sequence. The method is useful for diagnosing a the present sequence. The method is useful for diagnosing a predisposition to fat deposition or learness in a subject, and consequently for diagnosing a predisposition to non-insulin dependent diabetes mellitus (NIDDM) in a subject and conditions such as hypertension, glucose intolerance, dyslipidemia, hypertension, glucose intolerance, dyslipidemia, hypertension of preventive measures. Sequences ADI35084-ADI3503 represent PCR primers used in assays for verifying and genotyping single nucleotide polymorphism (SNP)s in a human PLA2GIB nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             human; PCR; ss; fat reduction; fat deposition; phospholipase A2; PLA2GlB; appetite suppressant; lipase inhibitor; exercise regimen; obesity; non-insulin dependent diabetes mellitus; NIDDM; cardiovascular disorder; hypertension; antidiabetic; primer.
                                                         Diagnosing a predisposition to fat deposition or leanness, useful for diagnosing a predisposition to e.g. diabetes or hypertension, comprises detecting the presence of a polymorphism in the PLA2GIB nucleic acid from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying a candidate therapeutic for fat reduction, useful for treating diabetes, by introducing a test molecule to a system comprising

This invention relates to a novel candidate therapeutic agent useful for far teduction and disorders related to fat depositions. Specifically, it refers to polymorphic variations in the phospholipase A2 (PLAZGIB) DNA, which is located on chromosome 1224 and has been associated with central cf at deposition. The present invention describes methods to detect the presence or absence of these single nucleotide polymorphisms of PLAZGIB, comparessant, and T918A3 and T918A3G, and subsequently provide treatment that reduces fat deposition. This treatment may consist of an appetite cuppressant, a lipase inhibitor, a phospholipase inhibitor, an exercise creduces fat deposition. This treatment may consist of an appetite crediment, a lipase inhibitor, a phospholipase inhibitor, an exercise regimen, addersary regimen, psychological counselling, psychotherapy or a crediment diabetes mellitus (NIDDM), as target for reducing fat deposition and it can be used to treat both obesity and non-insulin can be used to treat both obesity and non-insulin such as hypertension. As such, it exhibits antidiabetic activity. This oligonucleotide sequence is a PCR primer used to amplify a region of interest (i.e. genotype SNPs) in human PLAZGIB DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, matrix metalloproteinase 11; MMP11; ss; antisense oligonucleotide;
phosphorothioate linkage; 2'-0-methoxyethyl sugar moiety;
5-methylcytosine; hyperproliferative disorder; cancer; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a compound targeted to a nucleic acid molecule encoding a matrix metalloproteinase 11 (MMP11) polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New oligonucleotide compound that inhibits expression of matrix metalloproteinase 11, useful for preparing a composition for treating hyperproliferative disorder, e.g., cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human matrix metalloproteinase 11 DNA antisense oligonucleotide #27.
PLA2G1B protein or nucleic acid, and determining the presence of interaction between the compounds.

All cytosines // fnote= "MOTHER= phosphorothicate nucleotide. And 15 to 20 are 2'-methoxysethyl nucleotides."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to antisense compounds, compositions and methods for modulating the expression of kinesin-like 1. The superfamily of kinesins function as molecular engines to bind and transport vesicles
oligonucleotide comprises at least one modified internucleoside linkage 1.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylxytosine. The antisense compounds are useful for modulating the expression of the MMP11 polypeptide and in preparation of a composition for treating hyperpoiliferative disorders, e.g. cancer. This sequence represents an antisense oligonucleotide targeted to DNA encoding the human MMP11 polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antisense; kinesin-like 1; N2 kinesin; bimC kinesin; cellular proliferation; cancer; B-cell leukaemia; autoimmune disease; carpal tunnel syndrome; Raynaud's phenomenon; systemic sclerosis; Sjorgren's syndrome; rheumatoid arthritis; polymyositis; polyarteritis; systemic lupus erythematosus; mouse; ss; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense compound 8 to 80 nucleobases in length targeted to a nucleic acid molecule encoding kinesin-like 1, useful for treating an animal having a disease or condition such as cancer, tumor, autoimmune

and organelles along microtubules using energy supplied by ATP. Kinesin-

like 1, a member of the N2 (also called bimC) family of kinesins, is

involved in separating the chromosomes by directing their movement along

microtubules in the bipolar spindle. Kinesin-like 1 is also known as

KNSL1, Eg5, HsEg5, HKSP, KIFI1, thyroid interacting protein 5 and TRIPS.

CIMIDISTION of Kinesin-like 1 may be a target for arresting cellular

CP proliferation in cancer, due to its central role in mitosis. Expression

of kinesin-like 1 expression may contribute to other disease states such

CR and a B-cell leukaemia, autoimmune diseases such as carpal tunnel syndrome,

CR arthritis, polymyositis and polyarteritis. Kinesin-like 1 is an

crates to antisense nucleic acid oligomers, targeted to the gene

caucontigen identified in systemic lupus erythematosus. The invention

cralates to antisense nucleic acid oligomers, targeted to the gene

cancoding kinesin-like 1. Aleas to provided are methods of screening for

modulators of kinesin-like 1 and to methods of modulating the expression

of kinesin-like 1. At least a portion of the compound hybridises with RNA

croform an oligonucleotide-RNA duplex. It has at least one

croform an oligonucleotide-RNA duplex. It has at least one

croform an oligonucleotide-RNA duplex. It has at least one

croform an oligonucleotide and molety, or nucleobase. It has at least one

cromethoxyethyl sugar molety, phosphorothicate internucleoside linkage,

cromethoxyethyl sugar molety, phosphorothicate internucleoside linkage,

cromethoxyethyl sugar molety, prophorothicate internucleoside linkage,

cromethoxyethyl sugar molety, phosphorothicate internucleoside linkage,

cromethoxyethyl sugar molety, prophorothicate internucleoside linkage,

cromethoxyethyl sugar molety, with a 3'-unranalated region (UTR), with a seal of moletic acid molecule encoding kinesin-like

conjugunder of a nucleic acid molecule encoding kinesin-like

changes an antisense mucleis acid molecule encoding kinesin-like

coligonucleotide

                                                                                                                                                                                                                                                              ö
                   A new method for facilitating vascular growth is described which comprises inhibiting endothelial monocyte activating polypeptide (EMAP) II by down-regulating EMAP II expression, or by using EMAP II receptor antagonists or compounds that specifically bind to EMAP II e.g. antibodies. The method is useful treating patients at risk for ischaemic reperfusion injury to the luggs and newborn babies affected with bronchopulmonary dysplasia (claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polyworphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided

ö
in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to disease. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          is from exon 5 and contains a mutation which causes a nonsense codon at position 151 (AAV25622 is the normal wild type sequence). Adhalin belongs for the sarcolemal complex of dystrophin-associated proteins. Mutations in the adhalin protein are one of the causes of muscular dystrophy. A new method for the detection of a mutation in the human adhalin gene, comprises incubating a sample with a nucleic acid probe (e.g. present sequence). The probe specifically hybridises to the mutant form of the gene but not the wild type. Any specific hybridisation is then detected. The method is useful for detecting mutations in the human adhalin gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Genetic detection of primary adhalinopathies - using nucleic acid probes which bind to mutant adhalin genes but not the wild type gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a fragment of the human adhalin gene. It
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; adhalin gene; dystrophin-associated protein; muscular dystrophy; detection; mutation; primary adhalinopathy; Duchenne-like autosomal recessive muscular dystrophy; probe; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7401 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyphag studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agence and diagnostic methods, as well as the characterisation of the dispension of a side effects from differential efficacious responses to and side effects from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  pharmaceutical agents acting on a disease as well as other treatment. The invention relates to short interfering nucleic acids (siNA) which downregulate expression of HIV gene by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded.

They further comprise sense and any be double or alternatively are assembled from a sense oligonuclectide and an antisense oligonuclectide. Specifically, the siNAs include short interfering RNA (siRNA), doublestranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised, expressed from a cetor or enzymatically synthesised. The invention also relates to kite for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the HIV gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. HIV siNAs have anti-HIV activity. They may be used for inhibiting replication of HIV and may be used to treat HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New double-stranded short interfering nucleic acid, useful for treating infection with human immune deficiency virus, comprises sugar-modified

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of HIV gene by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are
                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New double-stranded short interfering nucleic acid, useful for treating infection with human immune deficiency virus, comprises sugar-modified pyrimidine bases.
                                                            ç
                                                                                                                                                                                                                                                                                                                                                                                                                        RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA; expression modulation; gene therapy; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; HIV; anti-HIV; HIV replication inhibition; HIV infection; ss.
infection. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of HUV-targeted double-stranded siNA, which is identical the HIV transcript target sequence.
                                                                                                                                                                 Gaps

cssembled from a sense oligonucleotide and an antisense oligonucleotide.

Specifically, the siNAs include short interfering RNA (siRNA), doublestranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain.

Cc can be unmodified or chemically synthesised, expressed from a ceoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits cort in twitro or in two delivery of siNA; conjugates and/or complexes of siNA; and vectors that express is siNA. The siNAs are used to modulate cort siNA; and vectors in grafts and transplants for the treatment by ex vivo gene therapy), or in grafts and transplants for the treatment cort avaitety of conditions. HIV siNAs have anti-HIV activity. They may be used for inhibiting replication of HIV and may be used to treat HIV infection. The siNAs are also useful for drug screening, diagnosis, infection. The siNAs are also useful for drug screening, diagnosis, cherapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the cort of lower strand of an HIV-targeted double-stranded sinA.

downregulate expression of one or more human epidermal growth factor receptor (EGRN) genes (including HBR1, HBR2 HBR3 and HBR4) by RNA interference. The sinAs may or may not comprise sense and antisense receptor (EGRN) genes (including HBR1, HBR2 HBR3 and HBR4) by RNA interference. The sinAs may or may not comprise sense and antisense or single stranded. They further comprise sense and antisense or regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the sinAs include short interfering RNA (shRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of EGFR genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants or corganisms (e.g., by ex vivo gene therapy), or in grafts and transplants or treating a wide range of cancers such as breast and ovarian cancer. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, cludying gene function, and gene mapping (e.g., of single mucleotide polymorphisms). The present sequence represents the lower strand of a FBR2 (EGFR2)-targeted double-stranded siNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human HER2 (EGFR2) transcript target sequence/sinA upper strand, SEQ:247
                                  New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of the epidermal growth
                                                                                                                                                                                                                                                         The invention relates to short interfering nucleic acids (siNA) which

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of one or more human epidermal growth factor computation (including HERA) HERA and HERA) by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense cregions, or alternatively are assembled from a sense oligonuclectide and an antisense oligonuclectide. Specifically, the siNAs include short interfering RNA (shRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (shRNA), The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised. Composessed from a vector or enzymatically synthesised. The invention also expressed from a vector or enzymatically synthesised. The invention also cand/or complexes of siNA; and vectors that express siNA. The siNAs are cused to modulate expression of EGFM genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants or creating a wide range of cancers such as breast and ovarian cancer. The siNAs are also useful for drug screening, diagnosis, therapeutic target condimination, and gene mapping (e.g., of single nucleotide collymorphisms). The present sequence represents the upper strand of a human HERZ (EGFRZ)-targeted double-stranded slNA, which is identical to the upper strand of a human HERZ (EGFRZ)-targeted double-stranded slNA, which is identical to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          coronary artery disease; CAD; coronary heart disease; CHD; atherosclerosis; hepatic glucose production; glucose—metabolism-related disorder; diabetes; cancer; breast cancer; colon cancer; lung cancer; neurological disease; Huntington disease; spinocerebellar ataxia; viral disease; AIDS; apolipoprotein B; apoB; ss.

continuous and an antisense sequence, where the sense sequences have sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical phosphorothioate modifications one or more asymmetrical phosphorothioate modifications sequences have one or more asymmetrical phosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (MI) apo8-100 care: a pharmaceutical preparation comprising (I); reducing (I); involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its cretivity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is cretivity, a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apo8-100 levels or glucose-6-phosphatase levels.

Constructed is unwanted expression of apo8-100, elevated or otherwise unwanted construction and expression of apo8-100, elevated or otherwise unwanted expression of apo8-100, elevated or otherwise unwanted construction and expression of apo8-100, elevated or otherwise unwanted expression of apo8-100, elevated or otherwise unwanted expression of apo8-100, elevated or otherwise unwanted ergonered ergone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               invention describes a RNA interference (iRNA) agent (I) comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 19 BP; 3 A; 6 C; 1 G; 9 T; 0 U; 0 Other;

and the antisense sequence targets a human gene sequence. Mass described are: a pharmaceutical preparation comprising (1); reducing (M1) apoB-100 levels or glucose-6-phosphatase levels in a subject; producing (I); stabilising (I), involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity, a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes a RNA interference (IRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-O alkyl modifications, the antisense sequences have one or more asymmetrical phosphorothicate modifications.
                                                                                                                                                                 cytostatic; anticonvulsant; noctropic; musculas; anti-HIV, RNA interference; iRNA; antisense technology; lipid metabolism; cholesterol imbalance; dyslipidaemia hypercholesterolaemia; coronary artery disease; CAD; coronary heart disease; CHD; atheroselerosis; hepatic glucose production; glucose-metabolism-related disorder; diabetes; cancer; breast cancer; spinocene; lung cancer; neurological disease; Huntington disease; spinocerebellar ataxia; viral disease; AIDS; apolipoprotein B; apoB; ss.

```
is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted levels of cholasterol, and/or disregulation of lipid metabolism. The disorder is chosen from the HDL/LDL cholesterol imbalance, dyslipidaemias, hypercholesterolasterol imbalance, dyslipidaemias, coronary artery disease (CAD), coronary heart disease (CHD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorder e.g. diabetes or type-2 diabetes. (I) is useful for treating the diseases as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological disease (e.g., Huntington disease or virence production or virence (e.g., breast, colon or lung cancer), neurological disease (e.g., AlDS). This sequence represents a human apolipoprotein B (ApoB) antisense oligonucleotide that

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This probe, along with AATISIGO, binds to part of a 50-kb region between sequence-tagged sites 54F and 5BS on chromosome-9p21, between amethylthioadenosine-phosphorylasse gene (AATISIG) and an interferon-alpha gene cluster, and may be used to isolate a cyclin-dependent protein-kinase-4-inhibitor (CDK4I) tumour suppressor gene. The CDK4I gene has been isolated as phage lambda clones 10B1-10 (AATISIS) and 10A1 (AATISIS) in Escherichia coli. The gene and its product may be used in diagnosis of cancer, particularly melanoma (especially dysplastic nevus

MTS polypeptide-encoding cDNAs and mutante of these are useful for the diagnosis or prognosis of human cancer. Germ-line mutations of MTS cDNAs can be used for diagnosing predisposition to melanoma, leukaemia, astrocytoma, glioblastoma, lymphoma, glioma, Hodgkin's lymphoma, CLL and cancers of the pancreas, thyroid, ovary, uterus, testis, kidney, stomach and rectum. The wild crype gene is useful for gene therapy and MTS polypeptides may also be used for protein replacement therapy. Also the polypeptides or cells contg, an altered MTS gene are
               may also be used in cancer gene therapy, or in antitumour antisense oligonucleotide or ribozyme construction. Antibodies against CDKAI may be

This is the nucleotide sequence of a nucleic acid used in the method of the invention involving the used of the multiple tumour suppressor (MTS) gene, to diagnose and treat cancer. The MTS gene is useful in the diagnosis and prognosis of human cancer, e.g. by standard nucleic hybridisation techniques, of patient samples. The mutated sequences are those that are present in somatic mutations of the gene in cancers. The weeters can be used for gene therapy strategies to replace function of mutated protein in patients. These can also be used to construct protein mimetics, also for therapeutic strategies. In addition the expression constructs can also be used for recombinant production of MTS.

Recombinant MTS can be used for recombinant production of MTS.

PCR primers AAV70587-93 were used to screen exons in human multiple tumour suppressor 1 (MTS1) gene for germline mutations. The MTS1 sequence is homologous to the corresponding murine gene. Primers designed from the gene can be used to design primars to detect abnormalities i.e. polymorphisms which may predispose towards malignancies such as melanoma, leukaemia, astrocytoma, lymphoma, glioma, as well as tumours of e.g. the breast, thyroid, pancreas, lucrus and kidneys. (Updated on 20-MAR-2003 to correct PF field.)
                                Mouse multiple tumour suppressor gene segment – useful for primer design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to the isolation of the gene encoding the human multiple tumour suppressor 1 (MTS1) (AAA95633). The MTS1 protein has a cytostatic activity and is used in protein replacement therapy. This sequence is a PCK primer used in the amplification and detection of mutations in the MTS1 gene. MTS1 is useful in diagnosing human cancers such as (ocular) melanoma, leukemia, astrocytoma, glioblastoma, lymphoma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel protein composition useful in protein replacement therapy for diagnosing and treating cancer comprises a specific weight percent of human multiple tumor suppressor 1 polypeptide.
                                                                                                                                                                                                                                                                                     Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cytostatic; human; multiple tumour suppressor 1; MTS1; diagnostic; cancer; gene therapy; protein replacement therapy; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                          This invention describes three human multiple tumour suppression proteins. The MTS gene locus is also referred to as the familial melanoma (MLM) gene locus, located on human chromosome 9p21. Germ line mutations in MTS genes can be used in the diagnosis of predisposition to cancers, e.g. melanoma, leukaemia, astrocytoma, gliboblastoma, lymphoma, glioma, Hodgkin's lymphoma, CiL, and cancers of the pancreas, breast, thyroid, ovary, uterus, testis, kidney, stomach and rectum. NOTE: This sequence is not mentioned in the specification but is given in the sequence ID listing. (Updated on 17-OCT-2003 to standardise OS field)

The invention relates to a method for diagnosing a polymorphism associated with a predisposition to cancer by detecting a germ-line alteration of a wild-type Multiple Tumour Suppressor (MTS) gene or its expression products in a human sample. The method comprises detecting a germ-line alteration of a wild-type MTS gene or its expression products in a human sample. The alteration indicating a predisposition to at least one of the cancers. The cancer is selected from melanoma, leukaemia, astrocytoma, glioblastoma, lymphoma, glioma, Hodgkin's lymphoma, chronic lymphocytic leukaemia, lymphoma, glioma, Hodgkin's lymphoma, chronic thyroid, ovary, uterus, testis, kidney, stomach and rectum. The method may be used as the basis for developing very important diagnostic tests capable of predicting the predisposition to cancer. The MTS gene is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents a PCR primer for the human multiple tumour suppressor 2 (MTS2) coding sequence of the invention. The DNA sequences are useful for diagnosing or determining a predisposition to cancers e.g. melanoma, leukaemia, lymphoma, glioma, Hodgkin's lymphoma and cancers of the pancreas, breast, thyroid, ovary, kidney, uterus and stomach
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Multiple tumour suppressor; MTG2; human; diagnosis; Hodgkin's lymphoma; cancer predisposition; melanoma; leukaemia; lymphoma; glioma; PCR primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Multiple tumor suppressor cDNA, useful for diagnosing or determining a predisposition to cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                          Gaps
involved in the progression of multiple tumour types and may provide means for a general anti-cancer therapy by virtue of its ability to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PCR primer for human multiple tumour suppressor 2 coding sequence.

(1) is useful for introducing wild-type MTS function to a cancerous or pre-cancerous cell introducing wild-type MTS function to a cancerous or pre-cancerous cell which carries diminished or mutant MTSIE1-beta. (1) is useful for increasing the carries for increasing the mutant growth of the recipient cells. (1) is also useful for increasing the mutant gene is expressed at a normal lavel but (1) is useful as a model system to study cancer remission and drug treatment which promotes such to study cancer remission and drug treatment which promotes such to study cancer remission and drug treatment which promotes such the present invention relates to sometic mutations and germ in mutations in the MTS gene and their use in the diagnosis and prognosis of human cancer e.g. melanoma, leukaemia, astrocytoma, glioblastoma, lymphoma, glioblastoma, and cancers of the pancreas, breast, thyroid, ovary, uterus, testis, kidney, stomach and rectum. The present sequence represents an oligonucleotide given in the sequence listing from the present invention, but which does not appear to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New vector useful for gene therapy of cancer associated with mutation in tumor suppressor gene, comprises DNA sequence of multiple tumor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a vector (I) comprising an isolated DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The invention relates to variants (AAA11196-A11206) of the human multiple tumour suppressor 1 (MTS1) gene (AAA11165). The variants have the following changes relative to the wild type coding sequence: A at any of positions 265, 442, 330 and 329; T at any of positions 172, 238, 341 and 148 and deletions of nucleotides 290-294, 172-179 or 128-129. The variants are somatic mutaations of MST1, indicative of predisposition to melanoma and many other cancers, so detecting them is useful for diagnosis, prognosis and monitoring of cancer (including prenatal analysis). Cells and animals that express the variants are useful as model systems for identifying potential anticancer agents. This sequence represents a primer used to screen for mutations in exon 2 of the MTS 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gарв

The present invention relates to a method for identifying a target base in a nucleic acid ("template"). A primer is used in the present method, which hybridises to the template adjacent to the target position. A polymerase reaction is then carried out on the primer and template in the presence of a nucleotide, which is incorporated and detected only when the nucleotide is complementary to the base in the target position. A single-stranded nucleic acid binding protein (SSB) is included in the polymerase reaction step. The present sequence is an oligonucleotide product, produced by the present method. This sequence was used to exemplify the advantages of the new method of the present invention. The method is useful for sequencing nucleic acids such as DNA and RNA and for identifying single nucleotide mutations which are characteristic of many
                                                                                                                                                                                                                                                                                                          Identifying a target base in a nucleic acid comprising polymerase reaction of a target sequence with a primer where a single single-grranded nucleic acid binding protein is included in the reaction, useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human antibody; detection; Fab; immunoglobulin; heterophilic antibody; human anti-mouse antibody; HAMA antibody; interleukin 8; IL-8; Herpes; target antigen; bacterial; fungal; viral; pathogen; human disease; hepatitis A; hepatitis B; hepatitis C; influenza; Giardia; Malaria; Leishmania; Staphylococcus aureus; Pseudomonas aeruginosa; diagnosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                 human sample containing human antibodies that specifically bind to
antibodies from a nonhuman species. The method involves contacting the
sample with a human antibody (1) which specifically binds to antibodies
cantibodies from a nonhuman species. The method involves contacting the
sample with a human antibody (1) which specifically binds to antibodies
c from a nonhuman species and detecting the binding between (1) and the
canalyte to indicate presence of the analyte. The method is used for
detecting an analyte in a human sample containing human anti-mouse
c antibody (HAWA) (preferably human anti-mouse idiotype antibodies and/or
heterophilic antibodies). The method can also be used for detecting any
type of target antigen including bacterial, fungal and viral pathogens
c that cause human diseases e.g., hepatitis (A,B and C), influenza, Herpes,
c diardia, Malaria, Leishmania, Staphylococcus aureus, Pseudomonas
c that cause human antibodies can be used as detection reagents for
performing clinical diagnostic tests and for performing other in virro
detection assays, including for research purposes. (1) can be used in
c detection assays, including for research purposes. (2) can be used in
c target antigens above minimally detectable amounts of antigen in the
c sample that usually correspond to the sensitivity limitations of the
assays for each target antigen. Also, (1) is used to determine the amount
c f target antigen in a semi-quantitative or relative sense.
C target antigen in a semi-quantitative can also be
c carried out using (1). AAH41612 to AAH41686, and AAB99361 to AAB99399,
crepresent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                        Detecting analyte in human sample containing human antibodies binding to
nonhuman-antibodies, involves contacting sample with human antibody which
binds to antibodies from nonhuman species and detecting binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; multiple tumour suppressor; MTS; cancer; gene therapy; ss.

                                                    The sequence represents PCR primer #3 used in analysis of multiple tumour suppressor MTS1 and MTS2. The MTS genes, and expression products, are useful for treating, diagnosing of prognosing human cancer. In particular, the MTS gene is useful for diagnosing a predisposition to or as a gene therapy for melanoma, leukaemia, astrocytoma, gliobastoma, lymphoma, chronic lymphatic leukaemia (CLL), or cancers of the pancreas, breast, thyroid, ovary, uterus, testis, kidney, stomach or rectum. The gene may be used in both cancerous and pre
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a method (M1) for producing a human antibody phage display library (1), comprising: (1) providing a nonhuman transgenic animal (II) whose genome comprises human immunoglobulin genes; (2) isolating nucleic acids encoding human antibody chains (III) from lymphatic cells; and (3) forming a library of display packages whose members comprise a nucleic acid encoding (III) which is displayed from the package. The method is used for producing a human antibody display library, e.g., a Fab phage display library. The display method may be used to screen nucleic acids encoding antibody chains obtained from immunised nonhuman transgenic animals, and from this a population of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Producing a human antibody phage display library comprises providing a transgenic animal whose genome comprises human immunoglobulin genes and isolating nucleic acids encoding antibody chains from lymphatic cells.

                display library using this method means there is no need to immunise humans with antigens, and the difficulties faced with immortalising B cells are avoided. AAH29958 to AAH30066 and AAB74994 to AAB75056 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to somatic and germ line mutations in the multiple tumour suppressor (MTS) gene in human cancer. The invention also relates to therapy of human cancer which have a mutation in the MTS gene, including gene therapy, protein replacement therapy, and protein mimetics. The MTS sequences are useful for diagnosing predisposition to human cancer or for diagnosing and prognosing predisposition to human cancer or for diagnosing and prognosing predisposition to human cancer or LL and cancers of pancreas, lymphoma, glioma, Hodgkin's lymphoma, CLL and cancers of pancreas, breast, thyroid, ovary, uterus, tessis, kidney, stomach and rectum. They are also used for screening drugs for cancer treatment. The present sequence is 42F primer used for amplifying human MTS1 exon 2 sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method for detecting the presence of polymorphisms associated with inflammatory bowel diseases such as ulcerative colitis and Crohn's disease. The methods can be used to detect the presence of genetic polymorphisms associated with inflammatory bowel disease and correlating their occurrence with disease states. They may be used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention
                                                                                                                                                                                                       Human; inflammatory bowel disease; Crohn's disease; ulcerative colitis; single nucleotide polymorphism; SNP; chromosome 19p13; paternity test; chromosome 5q31-33; forensic test; gene therapy; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Testing for the presence of polymorphisms associated with inflammatory bowel disease, using a hybridization assay.

New multiple tumor suppressor 2-specific antibodies useful for detecting differences in the absence of the peptides or mutant gene products, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to an antibody or its fragment that specifically binds to a human multiple tumour suppressor (WTS). The invention is useful for detecting differences in the absence of WTS peptides, to screen a tissue or to detect mutant MTS gene products. The antibodies will immunoprecipitate MTS proteins from solution as well as react with MTS protein on Western or immunoblots of polyacrylamide gels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gарв
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ophthalmological, cataract; crygs gene; lesion; crystalline lens;

                                                                                                                           Diagnosis and treatment of lesion of crystalline lens by using crygs gene and its product in pharmaceutical compositions, particularly for therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New method of preparing mammary gland bioreactor with macrofragment DNA for implementing site-specific and fixed time expression of target genes in mammary glands and producing transgenic animals.
                                                                                                                                                                                                                                       oŧ
                                                                                                                                                                                The invention relates to a method for the diagnosis of cataract susceptibility in an individual. The method comprises detecting variat: in the crygs gene, its transcript and/or protein of the individual by comparing with the normal gene to indicate the higher possibility in suffering from cataract. The crygs gene and gene-encoded protein are useful in the diagnosis and in pharmaceutical compositions for the treatment of a lesion of a crystalline lens, particularly for the cataract. This polymucleotide sequence represents an oligonucleotide related to the crygs gene of the invention

The present invention relates to antisense compounds and methods for modulating the expression of human phosphorylase kinase beta. The antisense compounds, partitularly antisense oligonucleotides, target and inhibit the expression of human phosphorylase kinase beta. The antisense compounds are useful for inhibiting the expression of human phosphorylase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "OTHER= Phosphorothioate internucleotide linkages, optionally bases 1-5 and 16-20 are 2'-methoxyethoxy (2'-MOE) bases, where the 2'-MOE cytidines are also 5'methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel antisense oligonucleotide which inhibits expression of phosphorylase kinase beta, useful for treating metabolic disorder e.g. diabetes, prevent or delay infection, inflammation or tumor formation.
                                                                           bioreactor using a large fragment of DNA, comprising injecting the DNA bioreactor using a large fragment of DNA, comprising injecting the DNA bioreactor using a fertilised ovum and transferring the ovum into a goat, where the target gene in the macrofragment has site-specific expression in the mammary gland of the goat. The method is useful for effectively implementing site-specific and fixed time expression of target genes in mammary glands and producing transgenic animals e.g. goats. The present sequence is an oligonucleotide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                        present invention relates to a method of preparing a mammary

                 particularly a human suspected of having or being prone to a disease or condition associated with expression of phosphorylase kinase beta such as a metabolic disorder e.g. diabetes. The compounds are useful for to prevent or delay infection, inflammation or tumour formation. The antisense compounds are useful in the preparation of a pharmaceutical formulation. They are highly specific, have an enhanced affinity for the humans. ABK68888-ABK6995 represent human phosphorylase kinase beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             or mouse tumor associated with
                                                                                                                                                                                                                                                                                     antisense oligonucleotides which comprise a phosphorothioate backbone

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to humanized antibodies against the surface antigen S of hepatitis B virus (HBV). The humanized antibodies comprise heavy and light chains, which have sequences of mouse origin at the heavy and light Complementarity Determining Regions (CDR) 1-3 (HCDR), HCDR2, HCDR3, LCDR1, LCDR2 and LCDR3). In addition, human anti-mouse antibody (HRMA) response is minimized by eliminating peptide sequences from heavy chain of the above humanized antibody which bind Major Histocompatibility complex (MHC) class II molecules. The antibodies are useful in preventing and/or treating hepatitis B virus infection in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
to a nucleic acid encoding human or mouse tumour necrosis factor receptor 2 (TURE2). Also described is a method for inhibiting expression of human or mouse TNFR2 comprising contacting cells or tissues in vitro with one of the claimed compounds. The antisense compounds are used to treat a disease or condition associated with expression of TNFR2. The present sequence represents a mouse TNFR2 antisense chimeric phosphorothioate oligonucleotide, which is given in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New humanized heavy or light chain antibody that specifically binds to the surface antigen S of hepatitis B virus (HBV), useful for preventing
                                                                                                                                                                                                                                Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Virucide, hepatotropic, vaccine, gene therapy, humanized antibody, surface antigen S; hepatitis B virus, HBV; heavy chain; light chain, mouse; Complementarity Determining Region; CBV; HCDR1; HCDR2; HCDR3; hepatitis B virus infection; PCR; primer; 89.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gapa

Synthetic linker sequence for heavy chain variable region PCR primer
   8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to humanized antibodies against the surface antigen S of hepatitis B virus (HBV). The humanized antibodies comprise heavy and light chains, which have sequences of mouse origin at the heavy and light Complementarity Determining Regions (CDR) 1-3 (HCDR1, HCDR2, HCDR3, LCDR1, LCDR2 and LCDR3). In addition, human anti-mouse antibody (HRMA) response is minimized by eliminating peptide sequences from heavy chain of the above humanized antibody which bind Major Histocompatibility Complex (MHC) class II molecules. The antibodies are useful in preventing and/or treating hepatitis B virus infection in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                  New humanized heavy or light chain antibody that specifically binds to the surface antigen S of hepatitis B virus (HBV), useful for preventing and/or treating HBV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention relates to a DNA construct for expressing in insect cells, a complete antibody light or heavy chain derived from the corresponding corresponding to a complete antibody light chain derived from the corresponding single chain Fv. For a vector for expression of a light chain (including one from a single chain Fv fragment), the cassette chain chain of the desired antibody. For a vector for a expression of light chain of the desired antibody. For a vector for a expression of heavy chain, the cassette includes the same signal sequence encoding the leavy chain of the desired antibody, and the coding construct also contains a promoter and a transcription terminator. Also construct also contains a promoter and a transcription terminator. Also included are the transformed insect cell expressing a desired antibody, and an Igd1 antibody derived from the expression in an insect cell of the construct, a passive vaccine against an infections agent recognised by the Igg1 antibody derived from the expression in an insect cell of the construct, a passive vaccine against an infections agent recognised by inserting the Igg1 antibody from a corresponding for for obtaining a conformationally active Igg1 antibody from a corresponding passive vaccine against an infections agent in a construct to isolate the Igg1 antibody in the insect cells are TN cells. The Igg1 antibody is useful for detecting an infections agent in a construct to isolate the Igg1 antibody is also useful for treating an infection caused by an agent recognised by the Igg1 antibody is also useful for detecting antifect of cantaining an infection saused by an agent recognised by the Igg1 antibody is also useful for detecting antigens specific for the antibodies in a sample suspected of containing such antigens, and for passive immunisation, especially in humans, without negative immunisation, especially in humans, without negative immunisation in the interpretating antigens and anaphylactic possive immunisation is such as serum sickness or anaphylactic pr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                          A new compound, which is 8-50 nucleobases in length targeted to a nucleic acid molecule encoding urokinase plasminogen activator, specifically hybridises with and inhibits the expression of urokinase plasminogen activator. The compound is useful for preparing a composition for treating (e.g. by gene therapy) hyperproliferative disorder, cancer e.g., breast, colon, bone, brain, ovary, cervix, endometrium, stomach or kidney cancer, or tumour metastasis. This sequence represents an antisense oligonucleotide used to modulate expression of urokinase plasminogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PCR; primer; ss; neoplastic; pre-neoplastic; heterozygosity; cytostatic; urothelial neoplasia; MTS1; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel method for detecting a cell with a neoplastic or pre-neoplastic phenotype, comprising testing a sample cell for the presence of loss of heteroxygosity at one or more loci on one or more chromosomes. The chromosomes are selected from a group of chromosome indicative of a neoplastic or pre-neoplastic phenotype. The method of the invention has cytostatic activity. Detecting a cell with a neoplastic or pre-neoplastic phenotype is useful for diagnosing, monitoring or treating pre-neoplastic phenotype is useful for diagnosing, monitoring or treating urchhelial neoplasia. The pregresent sequence represents a PCR primer used in the invention to amplify exon 1 of the MTS1 gene
                                                                                                                                                                                                                                                                                                                                                                                Detecting a cell with a neoplastic or pre-neoplastic phenotype, useful for diagnosing or treating neoplasia or pre-neoplastic conditions, comprises testing the cell for the presence of loss of heterozygosity at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /mod_base= OTHER
/note= "This oligonucleotide has a phosphorothioate
backbone and 2-'methyoxyethyl (2'-MOE) wings at the 5'
and 3' ends, which are 5 nucleotides in length. Also all
cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                        The present invention relates to novel antisense oligomucleotides (ADB99875-ADB9952) which are targeted to a human vitamin D nuclear receptor coding sequence (ADB99864), and specifically hybridizes with and inhibits the expression of vitamin D nuclear receptor. The antisense oligonucleotides are useful for treating an animal having a disease or condition associated with vitamin D nuclear receptor, e.g. cancer or developmental disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to novel tumour suppressor genes, termed as

The present invention relates to a method of identifying a predisposition to melanoma. The method comprises determining whether a human individual carrying a cyclin dependent kinase inhibitor 2h (DKNZA) mutant allele also carries a melanocortin-1 receptor (MCIR) variant allele, where the presence of a MCIR variant allele indicates a predisposition of the individual to melanoma greater than that expected as a consequence of the CDKNZA mutant allele alone. Also disclosed is a kit for identifying a predisposition to melanoma. The kit comprises MCIR gene-specific primers and/or CDKNZA gene-specific primers and MCIR variant allele-specific primers probes and/or CDKNZA mutant allele-specific
                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying a predisposition to melanoma comprises determining whether an individual carrying a cyclin dependent kinase inhibitor 2A (CDKN2A) mutant allele also carries a melanocortin-1 receptor (MCIR) variant
proteins. The polynucleotides are useful for preparing a composition for diagnosing or treating cancer. Sequences of the invention are also useful in gene therapy. The present sequence is human CDK41' exon DNA specific primer used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Predisposition; melanoma; human; cyclin dependent kinase inhibitor 2A;

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 mucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entilnflammatory steroid and ubiquinone. A composition of the invention has antilnflammatory, antiallargic, antiasthmatic, hypotenaive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of the dispunce or ung surfactant in a subject's tissue, or treating bronchoconstriction,

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding regalon, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an natiniflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a treat in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels antiinflammatory according a reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing bronchoconstriction,
                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone, A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a creventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an continummatory steroid in a subject, for reducing levels of antiinflammatory steroid in a subject, for reducing levels of continuous or receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction,
                                                                                                                                                                                  ò,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                         468
                                                                                                                                                                                                                                                                                                                                       RESULT
```

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, initiation codon, coding region, 5' or 3' end genomic flanking regions, or regions within 2-10 nucleotides of 5' and 3' intron-exon junctions or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antinflammatory steroid and ubiquinone. A composition may have a immunosuppressive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a immunosuppressive, lung or malignant disease or condition, also preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an ior in a subject, for reducing levels of adenosine correction, producing bronchodilation, increasing levels of biquinone or receptor, producing bronchodilation, increasing bronchoconstriction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pharmaceutical composition for treating ailments associated with impaired respiration, has Oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                         ö
lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to measuring DNA-dependent DNA polymerization in a biological sample and involves measuring the amount of incorporated modified deoxynucleoside triphosphate with the aid of the label of a bound antibody. The method is useful in measuring DNA polymerization for drug susceptibility testing. Sequences ABZ75637-647 represent different templates used for second strand synthesis by HIV reverse transcriptase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ONA polymerization; drug susceptibility; HIV; reverse transcriptase; RT;

oligonucleotide containing less percentage of adenosine, targeted t nucleic acids associated with lung airway or lung dysfunction, and

Claim 15; SEQ ID NO 3184; 763pp; English

bronchodilating agent

Pharmaceutical composition for treating asthma, has antisense

```
This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstruction, respiratory tract inflammation, allergies and reducing adanosine sensitivity, levels of adenosine (A) or (A) receptors, cufficing adanosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regularing arway or lung ayenestion of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery of the invention as antiallergic, antinflammatory, antiathmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to recease the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoonstriction and/or lung inflammation, allergies and/or bronchoonstriction and/or lung inflammation, allergies as the product on a pulmonary viseocometriction, respiratory disterses byndrome, pain, cystic fibrosis, allergic rhintis, pulmonary transplantation rejection, pulmonary infections, become submonary disease, pulmonary transplantation rejection, pulmonary infections, bundoning to the reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc., tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 20 BP; 6 A; 1 C; 10 G; 3 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel composition (a) a first active agent, CC comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating comprising adenosine sensitivity, levels of adenosine (A) or (A) receptors, curfactant depletion or hyposecretion, when administered to a mammal. The coligonucleotides are derived from a gene encoding or regulating cypreptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a composition comprises oligo and is administered to reduce the production composition comprises oligo and is administered to reduce the production composition comprises oligo and is administered to reduce the production composition to increase the degradation of the target mRNA or to creduce the amount of target polypeptide present in the lungs. The culting and/or bundlenmation, allergies and/or surfactant hypoproduction are associated inflammation, allergies and/or surfactant hypoproduction are associated
